Internship Report

Deloitte Australia – Cyber Job Simulation (Virtual Experience, issued via Forage)

Name	Akash Singh
Programme / Course	[Your degree and branch]
College / University	[Your institution]
Roll / Enrolment No.	[Your number]
Mode	Virtual, self-paced job simulation
Domain	Cyber Security
Completion date	22 October 2026

1. Introduction

This report documents my completion of the Cyber Job Simulation offered by Deloitte Australia on the Forage platform. The programme places the participant in the role of a member of Deloitte's cyber team who must support a client affected by a cyber security breach. It is a short, practical, beginner-level simulation guided by pre-recorded videos from Deloitte professionals and worked through with example answers.

2. Objectives

- To understand how a professional services firm responds when a client suffers a cyber security incident.
- To practise analysing technical evidence (activity logs) to recognise indicators of compromise.
- To build the habit of turning technical findings into clear conclusions and recommended next steps.
- To gain early exposure to the cyber security career path at a global consulting firm.

3. Task Undertaken

Task: Cyber security – how to support a client in a cyber security breach.

The simulation presented a client scenario in which a breach was suspected. My work involved:

1. **Understanding the situation.** Reviewing the briefing and the role of the cyber team in supporting a client during an incident.
2. **Reviewing web activity logs.** Examining recorded web activity to spot patterns that did not match normal user behaviour.
3. **Identifying suspicious behaviour.** Answering analysis questions to determine which activity was likely linked to the compromise.
4. **Recommending next steps.** Following the guidance of the Deloitte team to choose sensible remediation and response actions for the client.
5. **Comparing with expert answers.** Checking my responses against the example answers to learn where my reasoning matched or differed from professional practice.

4. Tools and Concepts Used

- Log analysis and event-data review
- Indicators of compromise and anomalous user behaviour
- Incident response and remediation planning
- Client-facing communication of technical findings

5. Observations

- Logs are the main evidence in an incident. Individually, many entries look harmless, and the suspicious signal usually appears only when entries are read in context and compared against normal behaviour.
- Speed matters, but accuracy matters more: a wrong conclusion can lead to the wrong response for the client.
- Cyber work is not only technical. The analyst must explain what happened, how serious it is, and what should be done next, in terms the client can act on.

6. Conclusion

The simulation gave me a practical first look at how a cyber incident is handled from the consultant's side. Although short, it connected classroom concepts in security to a realistic client scenario and strengthened my interest in a career in cyber security.

Certificate

Certificate of Completion – **Cyber Job Simulation**, Deloitte Australia, issued by Forage.

- **Awarded to:** Akash Singh
- **Date:** 22 October 2026
- **Area of practical tasks:** Cyber security
- **Enrolment Verification Code:** 6ad9b1005272042ebec3c653
- **User Verification Code:** 6ad9b0663cc587a0a131e964

Summary and Learning Outcomes

Summary

I completed the Deloitte Australia Cyber Job Simulation in October 2026. The task simulated supporting a client through a cyber security breach: reviewing web activity logs, identifying suspicious behaviour, and selecting appropriate remediation steps with guidance from Deloitte's cyber team.

Learning Outcomes

1. **Incident awareness.** I understand the basic stages of responding to a breach and the consultant's role in supporting the client.
2. **Log analysis.** I can read activity logs and pick out behaviour that deviates from normal patterns.
3. **Analytical judgement.** I learned to support a conclusion with evidence instead of assuming that unusual activity is automatically malicious.
4. **Remediation thinking.** I can propose logical next steps to contain and recover from an incident.
5. **Professional communication.** I practised presenting technical findings clearly for a client audience.
6. **Career insight.** I gained a clearer picture of what cyber roles at a professional services firm involve.

Skills Gained

Log analysis · Threat identification · Incident response basics · Problem solving · Client communication
